

80M Off Center Fed Antenna

For 80M, 40M, 20M, 15M, 10M Bands

Tips:

- Have the Antenna as high as possible.
- Best to use insulated wire, as uninsulated wire can interact with trees if touching.
- A Feed Line Choke is important to minimise RF down the coax.
- A 4:1 Current Balun is require for matching.
- The use of a Antenna Analyser is recommend so you can tune to all bands easier.

Tuning:

Make sure you have the Antenna at least 6 M above the ground. Although the lengths above should have a good SWR, you may need to shorten or lengthen as need.

Note: Diagram not to scale.
